Slides

Announcements

- Student presentations today:
  - Michael: A Fish May Hold the Key to More Efficient Wireless Networks
  - Mu-Te: W3C Launches Effort to Replace Passwords
  - Hsien-Chih: Google's Balloon-Powered Internet Ready for Carrier Testing

  web.cs.ucla.edu/classes/winter16/cs35L/assign/assign10.html

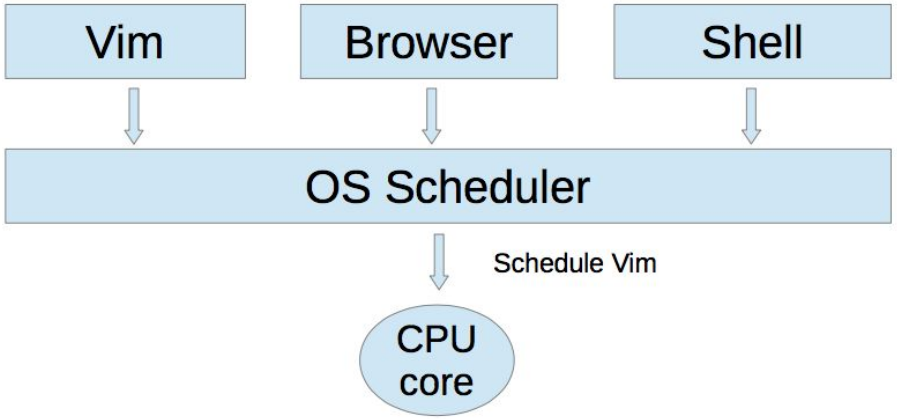
- Next week:
  - Write your topic here
  - Not registering you topic beforehand may result in rescheduling of your presentation
  - For reference on presentation, grading, please refer to this rubric.

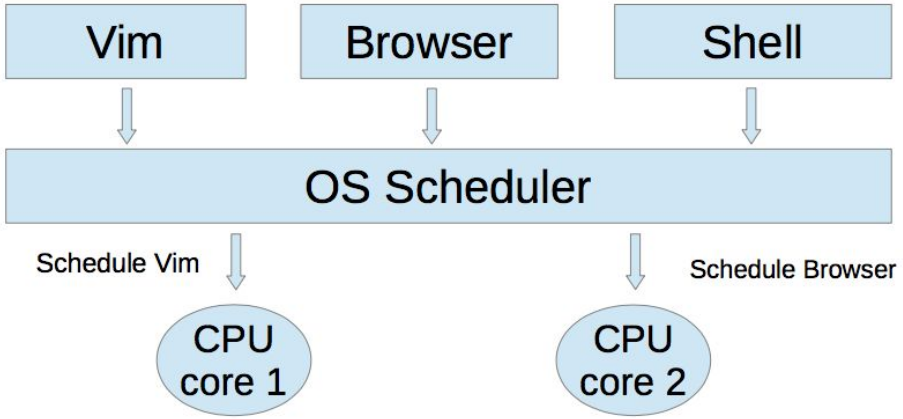
Multithreading/Parallel Processing

Week 8

Multitasking

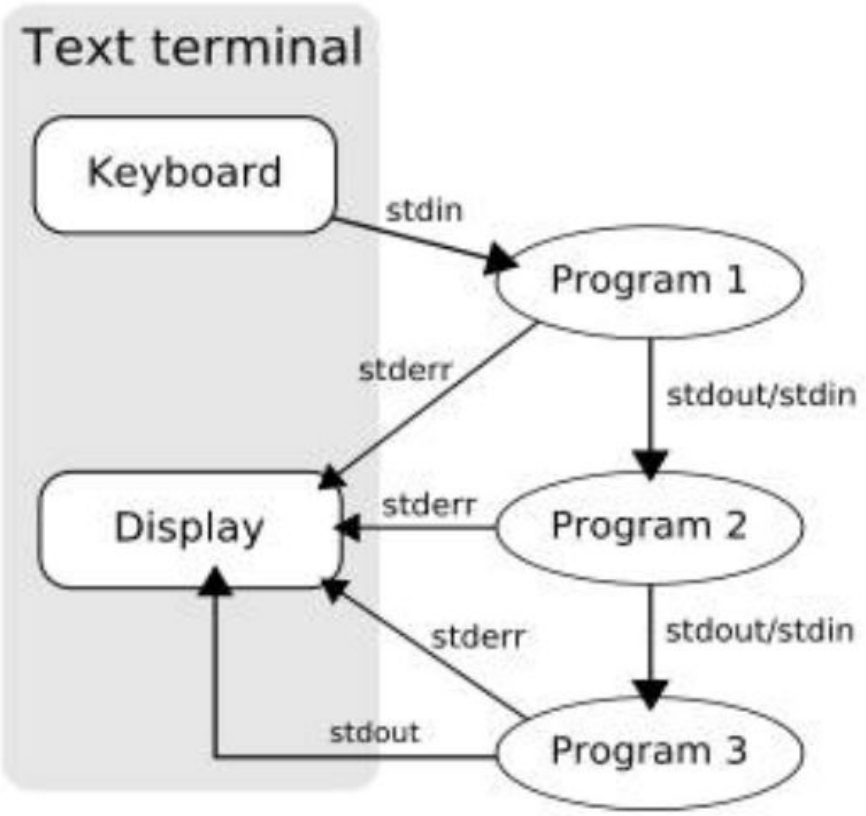
- Run multiple processes **simultaneously** to increase performance
- Processes do not share internal structures (stacks,globals,etc)
  - Communicate via **IPC** (inter-process communication) methods
    - Pipes, sockets, signals, message queues
- **Single core: Illusion** of parallelism by switching processes quickly (**time-sharing**). Why is illusion good?
- **Multi-core: True** parallelism. Multiple processes execute **concurrently** on different CPU cores





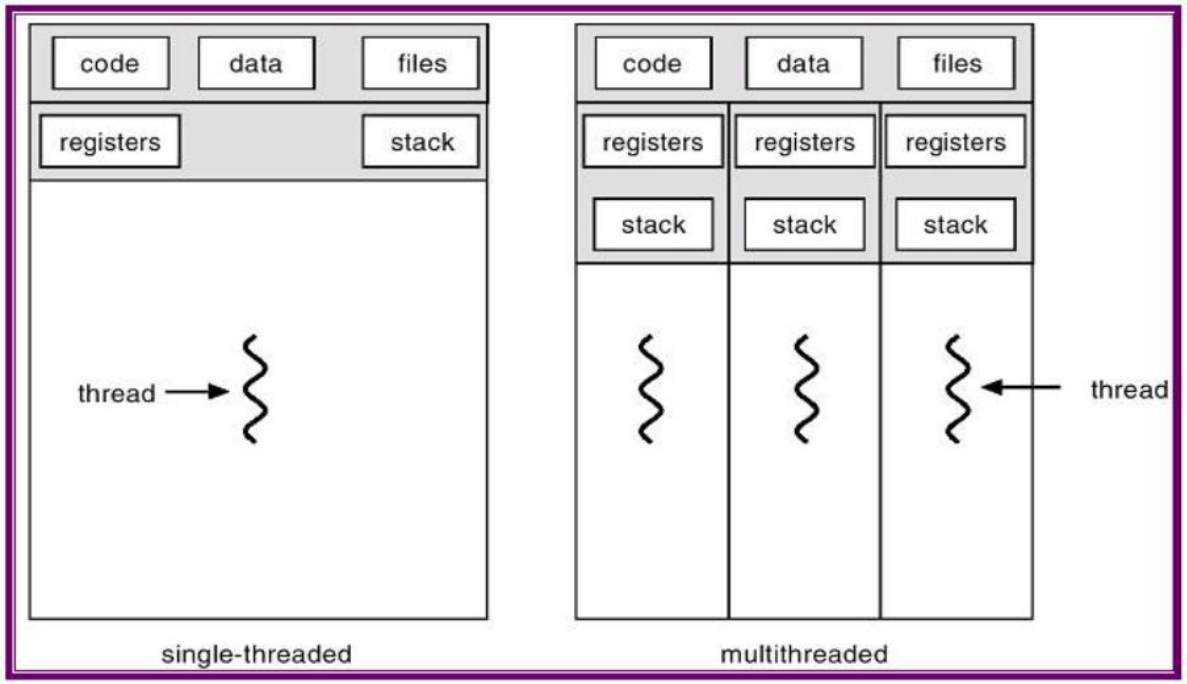
Multitasking

- `tr -s '[:space:]' '\n' | sort -u | comm -23 - words`
- Three separate processes spawned simultaneously
  - P1 - tr
  - P2 - sort
  - P3 - comm
- Common buffers (pipes) exist between 2 processes for communication
  - 'tr' writes its stdout to a buffer that is read by 'sort'
  - 'sort' can execute, as and when data is available in the buffer
  - Similarly, a buffer is used for communicating between 'sort' and 'comm



Threads

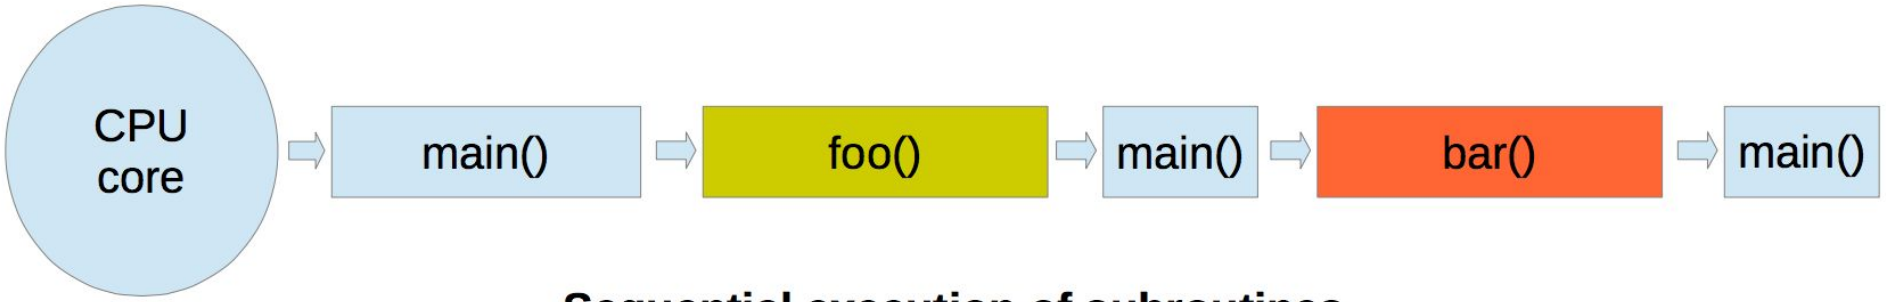
- A process can be
  - Single-threaded
  - Multi-threaded
- Threads in a process can run in parallel
- A thread is a lightweight process
- It is a basic unit of CPU utilization
- Each thread has its own:
  - Stack
  - Registers
  - Thread ID
- Each thread shares the following with other threads belonging to the same process
  - Code
  - Global Data
  - OS resources (files, I/O)



Single threaded execution

```
int global_counter = 0
int main()
{
    …
    foo(arg1,arg2);
    bar(arg3,arg4,arg5);
    …
    return 0;
}
```

```
void foo(arg1,arg2)
{
    //code for foo
}
void bar(arg3,arg4,arg5)
{
    //code for bar
}
```

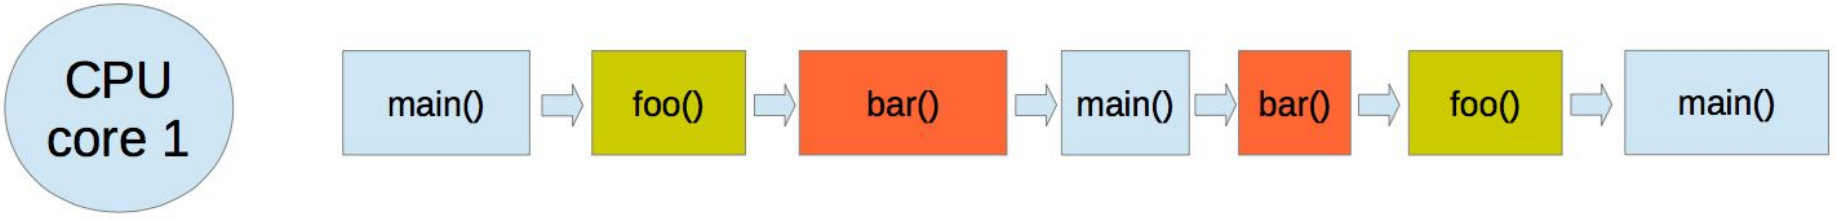


Sequential execution of subroutines

Multi threaded execution (single core)

```
int global_counter = 0
int main()
{
    …
    foo(arg1,arg2);
    bar(arg3,arg4,arg5);
    …
    return 0;
}
```

```
void foo(arg1,arg2)
{
    //code for foo
}
void bar(arg3,arg4,arg5)
{
    //code for bar
}
```

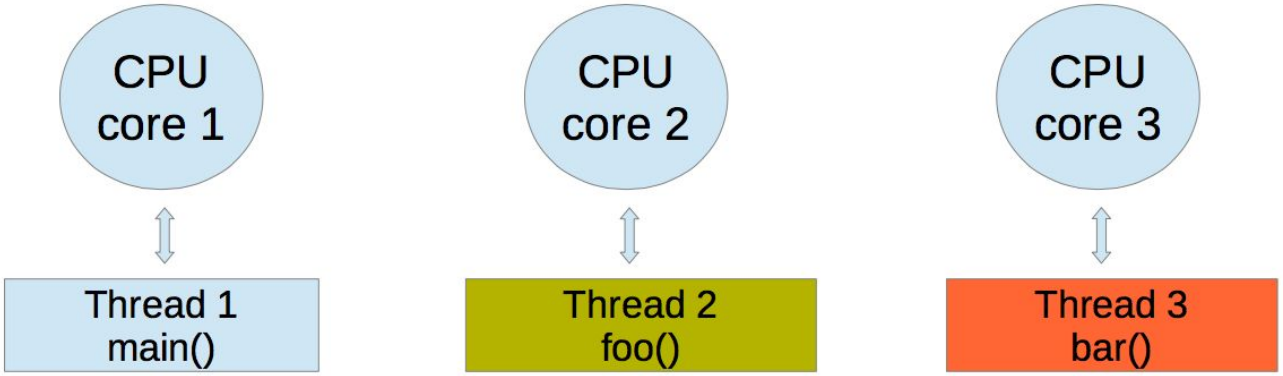


Time Sharing – Illusion of multithreaded parallelism
(Thread switching has less overhead compared to process switching)

Multi threaded execution (multiple cores)

```
int global_counter = 0
int main()
{
    …
    foo(arg1,arg2);
    bar(arg3,arg4,arg5);
    …
    return 0;
}
```

```
void foo(arg1,arg2)
{
    //code for foo
}
void bar(arg3,arg4,arg5)
{
    //code for bar
}
```



True multithreaded parallelism

Multithreading properties

- Efficient way to **parallelize** tasks
- **Thread switches are less expensive** compared to process switches (context switching)
- Inter-thread communication is easy, via **shared global** data
- Need **synchronization** among threads accessing same data

Pthread API

```
#include <pthread.h>
```

- `int` **`pthread_create`**`(pthread_t *thread,`
  `const pthread_attr_t *attr,void*`
  `(*thread_function) (void*), void *arg);`
  - Returns 0 on success, otherwise returns non-zero number

- `void` **`pthread_exit`**`(void *retval);`

- `int` **`pthread_join`**`(pthread_t thread, void **retval);`
  - Returns 0 on success, otherwise returns non zero error number

```
#include<pthread.h>  //Compile the following code as - gcc main.c -lpthread
#include<stdio.h>
void* ThreadFunction(void *arg) {
  long tID = (long)arg;
  printf("Inside thread function with ID = %ld\n", tID); pthread_exit(0);}

int main(int argc, char *argv[]) {
  const int nthreads = 5; pthread_t threadID[nthreads]; long t;
  for(t = 0; t < nthreads; ++t) {
    int rs = pthread_create(&threadID[t], 0, ThreadFunction, (void*)t);
    if(rs) {
      fprintf(stderr, "Error creating thread\n");
      return -1; }}
  printf("Main thread finished creating threads\n");
  for(t = 0; t < nthreads; ++t) {
    void *retVal;
    int rs = pthread_join(threadID[t], &retVal);
    if(rs) {
      fprintf(stderr, "Error joining thread\n");
      return -1;
  }}
  printf("Main thread finished execution!\n");
  return 0; }
```

Pthread API

Thread safety/synchronization

- **Thread safe function** - safe to be called by multiple threads at the same time. Function is free of ‘race conditions’ when called by multiple threads simultaneously.
- **Race condition** - the output depends on the order of execution
  - Shared data changed by 2 threads
    - int balance = 1000
  - Thread 1
    - T1 - read balance
    - T1 - Deduct 50 from balance
    - T1 - update balance with new value
  - Thread 2
    - T2 - read balance
    - T2 - add 150 to balance
    - T2 - update balance with new value

Thread safety/synchronization

- Order 1
  - balance = 1000
  - T1 - Read balance (1000)
  - T1 - Deduct 50
    - 950 in temporary result
  - T2 - read balance (1000)
  - T1 - update balance
    - balance is 950 at this point
  - T2 - add 150 to balance
    - 1150 in temporary result
  - T2 - update balance
    - balance is 1150 at this point
  - **The final value of balance is 1150**
- Order 2
  - balance = 1000
  - T1 - read balance (1000)
  - T2 - read balance (1000)
  - T2 - add 150 to balance
    - 1150 in temporary result
  - T1 - Deduct 50
    - 950 in temporary result
  - T2 - update balance
    - balance is 1150 at this point
  - T1 - update balance
    - balance is 950 at this point
  - **The final value of balance is 950**

Thread synchronization

- **Mutex (mutual exclusion)**
  - Thread 1
    - Mutex.lock()
      - Read balance
      - Deduct 50 from balance
      - Update balance with new value
    - Mutex.unlock()
  - Thread 2
    - Mutex.lock()
      - Read balance
      - Add 150 to balance
      - Update balance with new value
    - Mutex.unlock()
  - balance = 1100
- Only one thread will get the mutex. Other thread will **block in Mutex.lock()**
- Other thread can start execution only when the thread that holds the mutex calls **Mutex.unlock()**

Lab 8

- Evaluate the performance of multithreaded ‘sort’ command
  - `od -An -f -N 4000000 < /dev/urandom | tr -s ' ' '\n' > random.txt`
  - Might have to modify the command above
- Delete the empty line
  - `time -p sort -g --parallel=2 numbers.txt > /dev/null`
- Add /usr/local/cs/bin to PATH
  - $ export PATH=/usr/local/cs/bin:$PATH
- Generate a file containing 10M random **double-precision floating point numbers**, one per line with no white space
  - /dev/urandom: pseudo-random number generator

Lab 8

- `od`
  - write the contents of its input files to standard output in a user-specified format
  - Options
    - -t f: Double-precision floating point
    - -N <count>: Format no more than *count* bytes of input
- `sed, tr`
  - Remove address, delete spaces, add newlines between each float

Lab 8

- use `time -p` to time the command `sort -g` on the data you generated
- Send output to /dev/null
- Run `sort` with the `--parallel` option and the `-g` option: compare by general numeric value
  - Use `time` command to record the real, user and system time when running sort with 1, 2, 4, and 8 threads
    - $ `time -p sort -g file_name > /dev/null` (1 thread)
    - $ `time -p sort -g --parallel=[2, 4, or 8] file_name > /dev/null`
  - Record the times and steps in log.txt

Lab

web.cs.ucla.edu/classes/winter16/cs35L/assign/assign8.html

Ray-Tracing

- **Powerful rendering technique in Computer Graphics**
- **Yields high quality rendering**
  - Suited for scences with complex light interactions
  - Visually realistic
  - Trace the path of light in the scene
- **Computationally expensive**
  - Not suited for real-time rendering (e.g. games)
  - Suited for rendering high quality pictures (e.g. movies)
- **Embarrassingly parallel**
  - Good candidate for **multi-threading**
  - Threads need **not synchronize** with each other, because each thread works on a different pixel

Ray-tracing

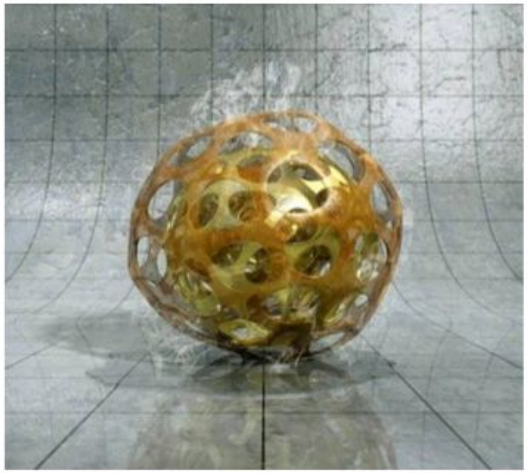


Image Source: POV Ray, Hall of Fame

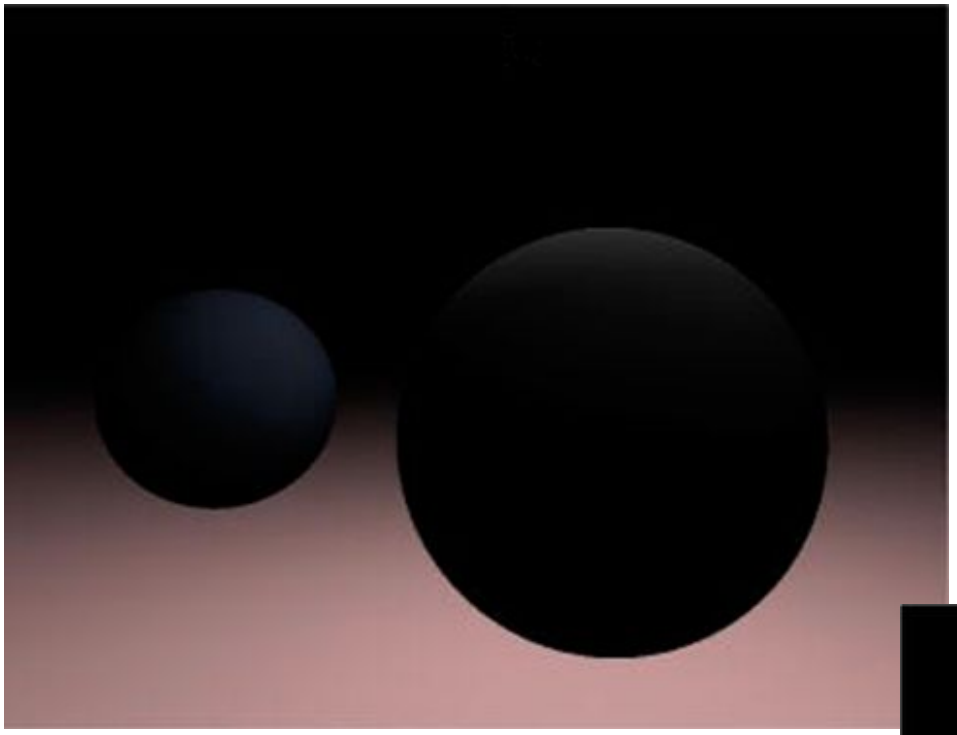
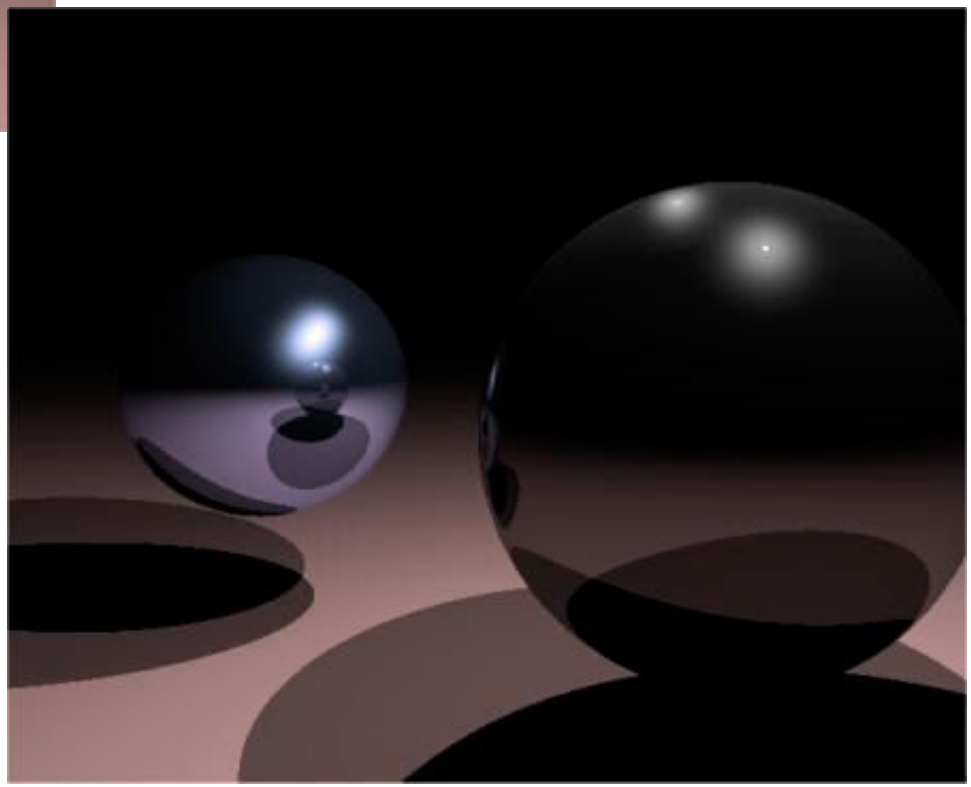


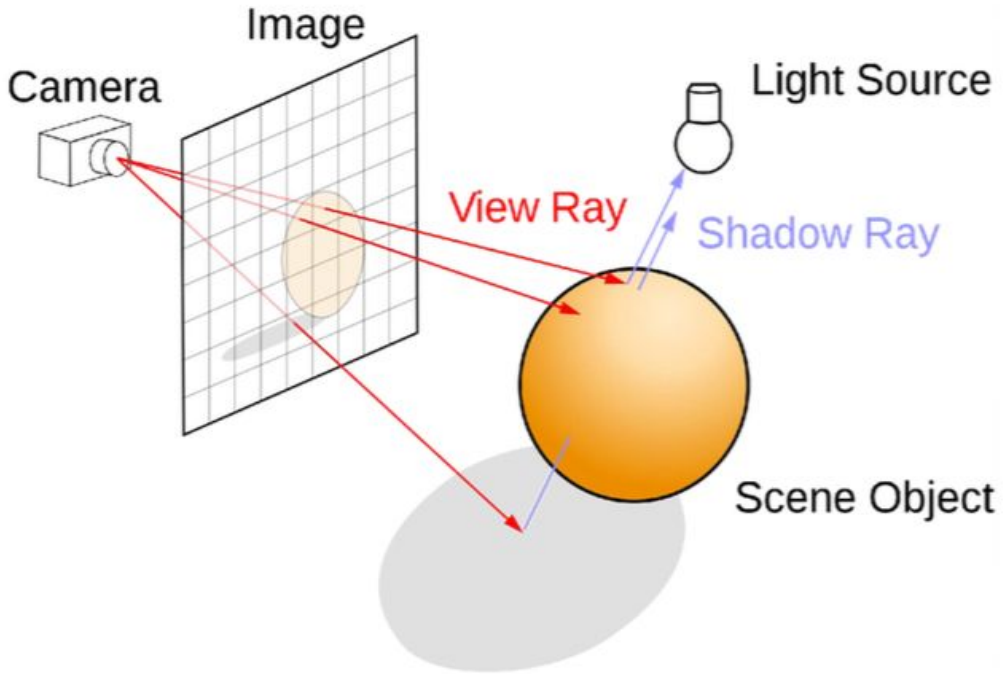
Without ray tracing

With ray tracing



Ray-tracing

- Trace the path of a ray from the eye
  - **One ray per pixel** in the view window
  - The color of the ray is the color of the corresponding pixel
- Check for **intersection** of ray with scene objects.
- **Lighting**
  - **Flat shading** – The whole object has uniform brightness
  - **Lambertian shading** – Cosine of angle between surface normal and light direction



Homework 8

- Download the single-threaded ray tracer implementation
- Run it to get output image
- Multithread ray tracing
  - Modify main.c and Makefile
- Run the multithreaded version and compare resulting image with single-threaded one

Homework 8

- Build a multi-threaded version of Ray tracer
- Modify “main.c” & “Makefile”
  - Include <pthread.h> in “main.c”
  - Use “pthread_create” & “pthread_join” in “main.c”
  - Link with –lpthread flag (LDLIBS target)
- make clean check
  - Outputs “1-test.ppm”
  - Can see “1-test.ppm”
    - sudo apt-get install gimp (Ubuntu)
    - X forwarding (lnxsrv)
    - gimp 1-test.ppm

1-test.ppm

Figure. 1-test.ppm

Homework 8 - antialiasing
